By February in Winnipeg, even your cheeks feel like they need moisturizer. The same dry, cold air that turns sidewalks into skating rinks also works on mouths. Add a handful of medications, a shifting bite, and the practical realities of aging, and you have the most overlooked health story on the Prairies. Teeth do not retire. They need fresh strategies.

I have spent years as a dentist in Winnipeg watching what time, climate, and life experience do to smiles. The picture is not grim. People in their seventies and eighties keep their teeth far more often than their parents did, and they chew steaks, laugh loudly, and smile for family photos without thinking about it. They just do it with better planning. The right advice is less about heroics and more about quiet, repeatable habits, a few smart products, and the occasional timely procedure.

What actually changes in an aging mouth

Enamel is strong, but it is not invincible. With decades of acid exposure from food and drink, microfractures from clenching, and old fillings that do not fit like they used to, teeth slowly lose their margin for error. Gums recede, not always because of disease, sometimes because of brushing like you are scrubbing a frying pan. Roots become exposed, which means decay can start in sneaky places. Root surfaces are softer than enamel, so one winter of sipping mints and nursing lozenges can undo five summers of good behavior.

Saliva production often dips. Aging salivary glands still work, but they become more sensitive to dehydration, caffeine, alcohol, and dozens of common medications, from blood pressure pills to antidepressants to bladder relaxants. Saliva is not just spit. It carries buffering agents, minerals that rebuild enamel, and proteins that slow cavity bacteria. Low saliva, especially paired with frequent sugar, is like turning off the sprinklers in July and wondering why the lawn turned brown.

Bones change too. The jawbone remodels throughout life. If a tooth is lost, the bone that held it starts to thin. That matters for dentures and implants. It also changes facial support, which then alters lip posture and airflow. People who never snored start snoring, and mouths open at night, drying tissues further. The cycle feeds on itself unless you meet it with the right countermeasures.

The Winnipeg factor, or why winter matters

If you have lived here long enough to remember misplacing your car in a snowbank, your oral tissues have felt the winter. Heated indoor air is dry, and bundled faces promote mouth breathing. I can often tell the season by the cracked corners of lips and the chapped palate. Combine that with the fact that winter routines often include cough drops, hot tea with honey, and less time outdoors, and the risk of cavities on root surfaces rockets up.

A small anecdote from my practice: a 78-year-old retired teacher, always an A student with her brushing, came in every February with two or three new soft spots along the gumline. We puzzled over it until we realized her quilting club ran through a large bowl of lemon candies each meeting. She was not chewing them, only sucking. It took three winters to retrain that habit to xylitol mints and timing sweets with meals, but her cavity rate dropped to zero. We did not change her flossing technique, only her winter sugar rhythm.

If you have respiratory issues and wear a scarf high across your face, good, keep your lungs happy. Just realize your mouth may dry out and plan for it with water sips, sugar-free lozenges, and a bedtime humidifier. Half the battle in our climate is moisture management.

Gums, bones, and the company they keep

Periodontal disease is the adult mouth’s quiet saboteur. It tends to simmer with few symptoms until it flares. The gums bleed sometimes, the breath shifts, teeth drift slightly, and one day a molar feels wiggly. In Winnipeg, where type 2 diabetes is common, I pay particular attention. Uncontrolled blood sugars make gum tissues more vulnerable to inflammation and infection, and chronic periodontal inflammation can in turn make glucose harder to control. It goes both ways.

People ask how often to come in. There is no single number, but here is my real answer. If your gums bleed when you brush, or you have pockets deeper than 4 millimeters, or you have a history of periodontitis with bone loss, you are a three to four month person. Take the shorter interval, it is cheaper than a loose tooth. If your gums score healthy year after year and your home care is locked in, six months is likely fine. A dentist in Winnipeg sees variations across seasons too. Dry winter months raise risk temporarily, so I tweak intervals accordingly.

News you can use: older mouths benefit more from interdental brushes than from floss alone. Hands change, shoulders ache, and even the most disciplined flosser misses angles. Interdental brushes, sized correctly, sweep plaque from concavities that floss skates over. If you have arthritis, an electric toothbrush with a chunky handle is 90 percent of the game.

Cavities after 60 are a different sport

You earned your fillings over time. Now the decay you face is often small, fast, and sneaky, starting at the edges of old restorations or on root surfaces. The good news is that dentistry has caught up with that pattern. We can stop lesions earlier.

Fluoride is not just for kids. I prescribe a 5000 ppm fluoride toothpaste for most older adults with any sign of recession, dry mouth, or frequent snacking. Use a pea sized amount at night, brush two minutes, spit, do not rinse. That 60 seconds of not rinsing makes all the difference. Varnishes painted on your teeth in the chair a few times a year lock in protection. If a small brown spot near the gumline looks suspicious, we sometimes paint it with silver diamine fluoride. It blackens the lesion, which is a trade off, but it can arrest the decay, avoid drilling, and buy you years of stability.

People ask about “natural” rinses. Many are fine as breath fresheners, but if your mouth is dry, alcohol based rinses make it worse. I steer patients toward neutral fluoride rinses at night and saliva substitutes during the day. Xylitol mints or gum reduce cavity bacteria over months. Aim for around 5 grams a day in divided doses, and do not give them to dogs.

Dentures that behave, and what to do when they do not

A well made set of complete dentures can look like a magic trick the day you first try them, but they are not self driving. Tissue changes slowly, the fit loosens, and bite forces shift. Upper dentures often feel secure because of suction. Lower dentures are a different story, especially if the bone is thin. Expect more movement. Adhesives help, and a soft reline every year or two often restores comfort. If you feel sore spots repeatedly, it is not just you being sensitive. Something is rubbing wrong. Come in and we adjust, it takes minutes and saves weeks of irritation.

Partial dentures are a fine compromise when you are missing a few back teeth. They stabilize the bite, protect the jaw joint, and cost far less than implants. The trick is maintenance. The metal clasps should feel snug but not like they need a crowbar. Brushing them with liquid soap, not toothpaste, reduces scratching. Sleeping with them out

gives tissues time to breathe. If a clasp loosens, we tighten it in the chair. Do not bend it yourself, even if you built your own deck last summer.

Implants after 60, still a yes with good screening

Here is my honest view. Age alone does not disqualify anyone from implants. I have placed and restored implants for people in their eighties that still work beautifully a decade later. What matters is bone quality, healing ability, oral hygiene, and a medication review that is not rushed.

If you take bisphosphonates or newer antiresorptives for osteoporosis, tell your dentist. The risk of jawbone healing problems is low for most tablet users, but it is not zero. We plan accordingly and coordinate with your physician. Diabetes that runs high makes infection more likely, so we tighten your glucose control first. Smoking cuts success in half. In winter, we time surgeries so you are not trudging on icy sidewalks for follow ups. None of these are deal breakers. They are details that keep your mouth healthy and your season calm.

A Winnipeg dentist will also weigh the value proposition. Sometimes, a single implant under a lower denture changes a life more than two implants replacing individual missing teeth. That single locator attachment can turn a skittish denture into a secure partner for a fraction of the cost of a full arch. Dentistry is full of elegant half steps like that.

Medication conversations worth having

Bring your medication list to every appointment. That baggie of bottles is more interesting to me than your last dental x ray. Blood thinners like warfarin, apixaban, or clopidogrel change how we handle extractions and periodontal surgery. We rarely stop them, we just plan so that bleeding is controlled and you do not go home worried. Many antibiotics interact with other medications or are not needed. A simple filling does not require antibiotics. If you have a prosthetic joint or a heart valve, the guidance is nuanced. Most patients do not need preventive antibiotics for routine cleanings. We will coordinate with your physician when the rules are unclear.

Dry mouth medications exist, and for a small subset they work well. Pilocarpine and cevimeline can stimulate saliva if your glands still have capacity. They come with side effects, so we try simpler measures first. Occasionally a nighttime dose of a saliva gel solves a problem that liters of water could not. People forget that water evaporates quickly from a dry mouth, while gels linger.

Caregiving, memory, and dignity in the bathroom

If you are helping a parent or spouse with dementia, the toothbrush can feel like a battle. A few tricks raise the odds. Brush side by side in front of a mirror and let them hold a second brush. Avoid commands. Sing, hum, or put on a favorite song. Use a child sized brush for tighter spaces. If they clamp, aim for the cheek side of the back teeth with small circles and call that a win. Perfection is not the goal. Consistency is.

I also advocate for simplicity on the counter. One electric brush, one high fluoride paste, one small bottle of rinse, and no clutter. Strong tastes can backfire. Neutral mint or unflavored pastes reduce resistance. If you are exhausted after a day of caring, focus on the night routine. The mouth dries out during sleep, so plaque and sugar surprise the tissues when the guard is down.

Nutrition you can actually chew

I am not your dietitian, but I do see the fallout of grazing on soft carbs. During dental exams I often hear this sentence: “I barely eat.” Then we unpack a typical day and find tea with honey at 10, yogurt at 11, applesauce at 1, a granola bar at 3, and pudding after dinner. None of those are villains alone, but the constant sugar bath feeds decay. The fix is not deprivation, it is timing. Cluster your sweets with meals when saliva is highest, and make snacks neutral, things like nuts, cheese, vegetables with hummus, or sugar free yogurt. Push protein, it repairs tissues and steadies blood sugar. Vitamin D and calcium matter for bone and teeth. If your dentures make steak feel like a dare, slow cook meats, choose ground options, and add flavor with herbs rather than sticky sauces.

Wine lovers ask about sipping in the evening. Acid plus sugar plus dry mouth is a trifecta. Drink your glass with food, rinse with water afterward, and wait at least 30 minutes before brushing so you do not scrub softened enamel.

Winter logistics that keep you out of trouble

We schedule older patients earlier in the day when roads are clearer and the sidewalks are less slick. Wear boots with real tread, bring indoor shoes for the chair, and do not be shy about asking for extra time to get settled. Acetaminophen before a long cleaning can make the experience calmer if your neck tenses easily. Scarves and masks are a fine shield for lungs, but if you notice your mouth cracking or your tongue feeling like sandpaper, put a small humidifier by the bed. Your mouth will thank you by morning.

If your hearing aids whistle against a mask or your glasses fog, tell us. We can adjust the headrest, remove the ear loops while you are in the chair, or use clips behind your head to keep things stable. Small comfort tweaks often make the difference between a good visit and a forgettable one.

The quiet power of regular maintenance

People often want a dramatic solution, a new set of teeth or an implant that erases decades. I get the appeal. Sometimes the highest yield move is far less cinematic. Cleanings every three or four months for a high risk mouth, fluoride varnish at each visit through the dry season, and a strict night brushing routine with a prescription paste often beat a crown in terms of years of comfort. A Winnipeg dentist with a long view will help you choose when to watch and fortify, and when to act.

Radiographs are a common question. We take as few as we can while still seeing what we need to. In older adults, bitewing x rays every 12 to 24 months catch hidden decay under old fillings. If you have pain or new symptoms, we take what the situation demands, not a template.

Two short lists worth taping to the fridge

- Daily routine for a lower risk mouth after 60:
- Brush twice a day with a soft electric brush, apply light pressure.
- Use a 5000 ppm fluoride toothpaste at night, spit and do not rinse.
- Clean between teeth daily with interdental brushes sized to your spaces.
- Keep xylitol mints or gum on hand for dry times, sip water often.
- Park dentures in water overnight, clean them with liquid soap, not toothpaste.
- Red flags that deserve a call to your dentist:

- Gums that bleed for more than a week, or a sore that does not heal in two.
- A denture that starts rocking after years of behaving, or creates new sores.
- Tooth sensitivity to cold that lingers, or pain when chewing.
- A white or red patch on the tongue or cheek that looks different from the rest.
- Loose teeth or drifting spaces where none existed last year.

How modern materials help older mouths

We have better toys than we did twenty years ago. Glass ionomer cements release fluoride and bond nicely to root surfaces, ideal for little cavities near the gumline. Composite resins come in shades that match the darker, more translucent look of aging enamel, so you do not leave looking like your teeth are wearing white sneakers with a tux. For fragile molars with large cracks, onlays made from high strength ceramics reinforce what is left without shaving away the healthy parts.

I am also fond of protective night guards for clenchers. Teeth do not love a lifetime of prairie hockey games or tax season Find more info spreadsheets. A well fitting guard reduces fracture risk, extends the life of crowns, and can make morning headaches vanish. If you wear a CPAP for sleep apnea, we tailor the guard to your mask straps so nothing fights at 3 a.m.

Money, coverage, and choosing where to invest

Manitoba Health does not cover routine dentistry for most adults. Some seniors have private plans, some have none, and many sit in between. I try to stack value where it counts. Preventive visits are cheaper than repairs. If money is tight this year, choose the cleaning and the fluoride varnish, and schedule the filling for the spring. If you are debating between whitening your teeth or stabilizing a cracked molar, pick stability now and aesthetics later. A dentist winnipeg patients trust will lay out options in plain language and help you stage care across seasons.

Ask about alternatives. A small silver diamine fluoride spot treatment might buy time before you need a filling. A bonded onlay may be a better choice than a full crown if the fracture is in a favorable spot. Dental care can be phased. When you feel pressure to decide immediately, slow things down. Good dentistry tolerates a thoughtful pace.

Why the little things matter more than heroics

Teeth age the way good boots do. They scuff, they take on stories, and they need polish. What keeps them useful is not a single expensive purchase, it is weatherproofing, the way you walk, and how you store them at night. If you want three tangible wins by next week, here is my short recipe. Switch to a high fluoride paste at night and stop rinsing. Add a correctly sized interdental brush to the evening routine. Carry xylitol mints and a water bottle when you leave the house, especially if the windchill could frost a moustache.

Your habits will beat my drill every time. I am a winnipeg dentist, proud of this city’s grit and humor. We have learned to thrive in a place where the snowbanks sometimes outlast the calendar. Your mouth can thrive too. If you need help getting from here to comfortable chewing, or you are not sure whether a sore spot matters, find a dentist in winnipeg who listens as much as they lecture. Dentistry at its best is not a lecture anyway. It is a conversation, a few clear tools, and the quiet satisfaction of eating what you love without a second thought.
