As the item rises, a multiplier boosts continually, beginning at **1.00 x**. The goal is easy: **squander before the multiplier "crashes."** If a gamer cashes out successfully at 2.50 x, they win their original bet multiplied by 2.50. However, if the video game crashes before they cash out, they lose their entire wager for that round.

Rounds occur rapidly, typically every 15 to 30 seconds, making the gameplay busy and interesting.

How Crash Mechanics Work

Understanding the backend of how Crash works helps debunk the game. Many reputable Crash CSGO sites make use of **Provably Fair** algorithms. This cryptographic system allows players to confirm that the result of each and every single round was predetermined and objective, making sure the site owner can not manipulate the lead to real-time.

2. **The Takeoff:** The multiplier begins at 1.00 x and ticks upward.
3. **The Crash:** At a completely random point determined by the algorithm, the multiplier stops ("crashes"). This can occur anywhere, even quickly at 1.00 x (often described as an "immediate bust").

Multiplier Range Likelihood (Approximate) Risk Level
1.00 x-- 1.05 x Extremely High (~ 5%) Extremely Low
(Frequent instant busts) **1.06 x-- 2.00 x** Moderate (~ 45%) Low to Moderate
2.01 x-- 5.00 x Low (~ 30%) Moderate to High
5.01 x-- 10.00 x+ Very Low (~ 20%) High to Extreme

Keep in mind: Exact likelihoods vary slightly depending upon the specific house edge (normally set in between 1% and 5%) built into the platform's algorithm.
