What is the Limbo Crypto Game?

Limbo is a crash-style gambling establishment game, though it differs slightly from conventional crash games where a multiplier line rises constantly until it crashes. Instead, Limbo is a target-multiplier game.

When a gamer opens a Limbo game, they configure two main parameters:

1. **The Bet Amount:** How much cryptocurrency they desire to bet on the round.
2. **The Target Multiplier:** The payment multiplier they wish to attain (e.g., 2x, 10x, 100x, or perhaps approximately 1,000,000 x).

As soon as these are set, the player initiates the round. The game generates a random number. If the produced number is **higher than or equal to** the target multiplier, the player wins their bet multiplied by that target. If the produced number fails, the bet is lost.

How Limbo Works: The Mechanics Behind the Bets

To understand why Limbo is so popular in the crypto gambling community, one need to take a look at its core engine: **Provably Fair algorithms**.

Unlike standard online gambling establishments where game results are determined on a black-box server, crypto-native video games utilize cryptographic hashing (typically making use of SHA-256). Before a bet is put, the casino creates a hashed variation of the winning result. After the round concludes, players can confirm the mathematics to guarantee the casino did not manipulate the result.
