

What eventing horses need from horse feed

Eventing horses need more than a simple increase in calories. Their work asks for repeated bursts of effort, a calm but responsive mind, efficient **energy** use, and the ability to recover quickly between phases. The right **horse feed** supports **stamina**, helps maintain **muscle condition**, and keeps the horse feeling forward without becoming sharp or difficult.

Good **performance nutrition** for eventing is built around **forage first**. That means the base of the diet should be **roughage** such as **hay** or **haylage**, with additional feed chosen to match **training workload**, body type, and the demands of the **competition season**. A horse doing regular flatwork, jumping, galloping, and cross-country work needs **slow-release energy** rather than a quick spike. That is where the balance of **fibre**, **protein**, and carefully managed **sugar and starch** counts.

The best diets also support **digestive health**. Eventing horses can face changes in routine, travel, and heat, all of which can affect **gut health**. A steady, fibre-based diet helps keep digestion more stable and can reduce the risk of poor appetite or stress-related problems. If the horse is underweight, lacking topline, or losing condition under work, the feed plan may need greater **calorie density**, more digestible fibre, or a better-quality **conditioning feed**.

Types of horse feed for competition horses

There are various **types of horse feed** that can work for competition horses, but the best choice depends on the horse's temperament, workload, and current condition. The majority of event horses do well on a mix of forage and a selected concentrate or complete feed. The aim is to deliver enough fuel without overloading the digestive system.

A **complete horse feed** is designed to offer a broad nutrient profile in one product. It can be useful when you want simplicity and consistency. A **horse feed mix** usually combines different ingredients such as cereals, fibre sources, and added nutrients. **Concentrates** are feeds that supply extra energy and nutrients beyond forage and are often used when a horse needs more fuel for work, growth, or poor body condition.

Typical options include:

- **Conditioning feed** for horses that need more body condition and muscle support.
- Fiber-rich feeds for horses that need steady **energy release** and a calmer ride.
- Cereal-based feeds for horses with higher demands and good tolerance for starch.
- **Ration balancer** products for horses needing vitamins, minerals, and amino acids without extra calories.

For eventing horses, the safest approach is usually to choose feeds that support performance without excessive bulk. Some horses thrive on a simple complete feed, while others need a tailored mix of forage, concentrates, and targeted supplements for **electrolytes** or extra **protein**. Always consider how the feed interacts with workload, temperament, and the horse's ability to maintain **muscle tone**.

How to build a practical diet plan

Effective feeding starts with **horse feeding rules** that protect health and performance. The first rule is to keep **forage** as the foundation. The second is to avoid big changes in feed too quickly. The third is to adjust the ration to work, body condition, and travel demands.

A **horse feeding chart** can help you plan the daily ration. It does not need to be complicated. A basic chart should include forage amounts, concentrate amounts, water access, and timing around exercise. Many owners also use a **horse feed calculator uk** tool to estimate intakes based on bodyweight, work level, and desired condition. These tools <http://www.kansasnewsheadlines.com/news/story/582403/with-half-of-britains-horses-overweight-bifid-launches-grainfree-lowsugar-feed-for-the-nations-gooddoers.html> are practical starting points, but they are not a substitute for watching the horse closely.

A good plan typically includes:

- **Forage first** in sufficient quantity to support digestion and calm behaviour.
- Concentrates split into smaller meals to protect **digestive health**.
- Extra fuel adjusted to the horse's **training workload** and **competition season**.
- Fresh water and **electrolyte replacement** after sweating and travel.
- Regular review of **body condition score** and muscle coverage.

Use **hay** or **haylage** as the primary source of **roughage**, then build around that. A horse doing light arena work may need a lower **feed rate** than one preparing for a full event weekend. If the horse is losing condition, you may increase energy through digestible fibre or add more calorie-dense concentrates. If the horse becomes too fresh, reducing starch and focusing on fibre can help maintain steadier behaviour.

The most practical feeding plan is the one the horse can digest consistently while still meeting the demands of work, travel, and recovery.

Horse feed for newcomers: easy steps before you alter anything

If you are new to **horse feed for beginners**, keep the process straightforward. Don't change everything at once. Start by checking what the horse is currently eating, how much work it is doing, and whether the horse is maintaining weight, muscle, and energy. Practical **horse feed advice uk** often begins with a forage assessment before any bucket feed is added.

Before changing the diet, ask three questions: Is the horse maintaining **body condition score**? Is it holding muscle over the top line and hindquarters? Does it seem flat, anxious, or slow to recover? This feedback help determine whether the current ration has enough energy, protein, and micronutrients.

If a change is needed, use a careful **diet transition**. Add the new feed over several days, mixing it with the current ration. That supports **gut health** and lowers the risk of digestive upset. Changes to forage should also be gradual, especially when moving between **hay** and **haylage** or altering the source of concentrates.

Veterinary advice is crucial if the horse has unexplained weight loss, poor appetite, loose droppings, a history of colic, or signs of ulcers. A vet can help identify whether the issue is nutrition, workload, pain, or another health problem. Feeding is most effective when it is part of a wider overall plan.

When a all-in-one horse feed is a good choice

A **complete horse feed** makes sense when you want a simple diet that delivers a **balanced ration** in one convenient package or a basic mix of feeds. It is especially helpful for horses that need a reliable supply of **vitamins and minerals**, extra energy, and support for **muscle condition** without having to formulate a ration from many separate ingredients.

This can be a useful solution for eventers in moderate to hard work, especially if they are travelling, racing frequently, or needing a steady feeding schedule. A complete feed can reduce the risk of nutrient gaps and make it easier to manage the horse's intake while keeping the feed programme easy to follow. For some horses, it also makes it easier to keep the ration in line with the ideal **condition score**.

Complete feeds are not automatically more suitable than a bespoke mix, though. The best choice depends on what the horse needs and how well it handles certain ingredients. Some horses do better with higher fibre and reduced starch. Others need more concentrated calories. If you choose a complete feed, check how it fits with the hay or haylage, the amount of work, and any additional balancer or supplement already being used. A feed that already covers essential nutrients may reduce the need for extras and simplify management.

How much does horse feed cost and what affects it?

Horse feed cost varies widely based on feed type, ingredient quality, brand, and the quantity needed each day. One of the biggest factors is the **feed rate**. A lower-quality feed may look cheaper per bag but require a larger daily amount, which increases the true monthly cost. A more concentrated feed can seem expensive at first but may end up more efficiently if the horse needs less of it.

Other factors include **bag size**, the number of feeds required per day, and whether the ration relies on concentrates, complete feeds, or forage-based additions. Some **horse feed companies** offer smaller bags for easier trialling, while others focus on larger-format products for established routines. Packaging does not change the nutritional value, but it does affect convenience and cost planning.

Cost also depends on whether you need specialist performance support, such as a conditioning product, an electrolyte top-up, or a feed tailored for horses with sensitive digestion. When budgeting, remember that the cheapest feed is not always the most economical if it fails to support performance, recovery, or weight maintenance. A horse that performs well, stays healthy, and keeps condition often saves money elsewhere.

Picking makers and evaluating horse feed companies

There are plenty of **horse feed companies** on the market, and brand choice should be guided by **ingredient quality**, transparency, and suitability for the horse's work. A well-known example is **spillers horse feed**, which many owners consider when looking for established **performance feed** options. That said, brand reputation alone should not replace a careful look at the label.

Evaluate feeds by checking the nutrient profile and ingredient list. Look for detailed information about **sugar and starch**, fibre sources, protein level, added **vitamins and minerals**, and whether the feed is designed for endurance, eventing, or condition gain. The best products support performance without making the horse overly excitable or too bulky.

Practical comparison points include:

Bifid UK

+44 800 422 0888

sales@bifid.co.uk

<https://bifid.com/uk/>

- Is it suitable for the horse's temperament and training level?
- Is the calorie source mainly fibre, oil, starch, or a mix?
- Does it supply enough micronutrients without overfeeding?

- How easy is it to match the recommended **feed rate**?
- Will it fit with the rest of the ration and current forage?

For eventing horses, the most effective feed is the one that supports consistent training, competitive effort, and good recovery. A good brand is important, but the formulation matters more than the logo.

horse feed mix recipe suggestions and things to avoid

A simple **horse feed** recipe mix for eventing horses might [overweight horse feed](#) use a high-fibre base, a controlled cereal component, and a balancer or mineral supplement. The goal is not to create the largest bucket of feed, but the most useful one. Many owners use a mix that includes fibre cubes or chop, a conditioning or performance concentrate, and a small amount of cereal where appropriate.

Common ingredients include **oats** and **barley**. Oats can provide readily available energy, while barley is denser and can be useful in some diets when processed correctly. However, both can raise the starch load, so they must be used carefully, especially if the horse is sensitive to high **sugar levels** or becomes excitable on cereal-heavy rations.

Things to avoid:

- Abrupt large cereal increases without feed transition.
- Heavy use on starch when the horse does better on fibre.
- Mixes that are too low in protein for muscle support.
- Rations that ignore electrolytes, vitamins, and minerals.
- Unbalanced recipes that exceed the horse's true energy needs.

A good mix should support the horse's workload, not work against it. For many eventers, a moderate-starch approach with enough fibre, digestible energy, and targeted micronutrients is more effective than a heavy cereal feed. Always keep an eye on behaviour, appetite, and recovery after training sessions.

Common feeding mistakes in eventing horses

One of the most common mistakes is ignoring the basics of **horse feeding rules**. Another is feeding too much concentrate and too little forage. That can undermine **gut health** and increase the risk of digestive problems. Eventing horses are often asked to do more work while travelling more often, so the feeding routine must protect the stomach as well as fuel performance.

Colic and **ulcers** are serious risks when management is poor. Long gaps without forage, sudden changes in ration, too much starch, insufficient water, and stress during travel can all contribute. For some horses, the signs are subtle: reduced appetite, grumpiness, poor recovery, dull coat, or inconsistent work.

Another problem is seeking fuel without paying attention to feed quality. Too much feed is not always better. Eventing horses need carefully balanced **performance nutrition**, not just extra calories. If a horse is short of condition, check whether the issue is too little forage intake, inefficient digestion, too little protein, or a mismatch between the ration and the actual workload.

Finally, do not forget hydration. A horse working hard and sweating can lose water and minerals quickly. **Electrolytes** and water access are vital for recovery, especially during the competition season. Good feeding is always linked to good management, including rest, turnout, and routine.

FAQ: horse feed for eventing horses

What is the best horse feed for eventing horses?

The best horse feed for eventing horses is one that delivers steady energy, maintains muscle tone, and fits the horse's workload and temperament. In many cases, that means a forage-led diet with a suitable complete feed or concentrate, plus enough protein, vitamins and minerals, and electrolytes to support recovery. The best option is not always the most energetic feed; it is the one that keeps the horse in shape, rideable, and consistent.

How do I choose between complete horse feed and a mix?

Choose a complete horse feed if you want convenience and a more balanced ration in one product. Choose a mix if your horse needs a more tailored approach to starch, fibre, protein, or calorie density. The right answer depends on body condition score, training workload, and how well the horse handles different ingredients. If in doubt, review the label and consider veterinary advice or a qualified nutritionist.

How much horse feed does an eventing horse need?

The amount depends on bodyweight, condition, forage intake, and work level. A horse in heavier training may need more concentrates, while a horse with good forage intake and efficient digestion may need less. Use a horse feeding chart or a horse feed calculator uk tool as a starting point, then modify by watching energy, muscle condition, and recovery. The goal is to meet needs without overfeeding.

How much does horse feed cost per month?

Horse feed cost varies based on bag size, feed rate, brand, and whether you use complete feeds, concentrates, or specialised conditioning feed. A cheaper bag can turn expensive if the horse needs a high daily amount. The best way to estimate monthly cost is to work out the daily ration, multiply by 30, and compare that with the bag weight and feeding guide. Forage, supplements, and electrolytes should also be counted in your budget.

What are the most important horse feeding rules to follow?

The most important horse feeding rules are to keep forage first, change the diet gradually, feed smaller concentrate meals rather than large ones, provide clean water at all times, and match the ration to training workload and condition. Protect gut health by avoiding sudden feed transitions and excessive starch. Regularly review body condition score, muscle tone, and recovery so you can adjust the ration before problems develop.
