Is Pest Control Safe for Children and Pets in Indianapolis Homes

For families with young children, dogs or cats, safety is usually the first concern when booking pest control. Nobody wants to swap an ant problem for a worry about what has been sprayed on the kitchen floor. The good news is that modern pest control, carried out properly by a licensed company, is designed with households like these in mind.Termishield's technicians use professional-grade products applied according to industry standards and label directions. That last point matters. Pest control products are regulated, and their labels set out exactly how, where and in what quantities they can be used. A licensed technician follows those directions, which is very different from a homeowner spraying an over-the-counter product liberally around the house. Termishield holds Indiana company license F35923, and its technicians are trained in safe application.Much of modern pest control is also highly targeted. Gel baits for cockroaches are placed inside cracks and cabinet hinges, out of reach of children and pets. Termite bait stations are installed in the soil around the outside of the home. Exterior perimeter treatments focus on the foundation and entry points rather than the interior living space. Rodent control increasingly relies on trapping, tamper-resistant devices and exclusion work that seals gaps, rather than loose bait.Termishield also offers eco-friendly treatment options for households that want them. The company's approach is that protecting a home should not mean compromising a family's health or the environment, and technicians can discuss the options available for each pest and property.Communication is the other half of safety. Before service begins, Termishield's technicians explain the treatment process and give any necessary instructions, such as keeping pets and children away from treated areas until they are dry, removing pet bowls and toys from areas being treated, or preparing rooms ahead of a bed bug treatment. Homeowners are encouraged to mention any allergies, sensitivities or particularly curious pets so the plan can be adjusted.There are also simple precautions any household can follow: keep children and pets away from technicians while they work, follow any re-entry guidance, and store any products left by the technician out of reach.Pest problems themselves carry health risks. Cockroaches trigger allergies and asthma, rodents contaminate food and surfaces, and stinging insect nests near play areas can be dangerous. Treating them safely and promptly protects Pest control the family. Termishield's Indianapolis team can talk through safety questions during a free inspection. Call the East Washington Street office to arrange one.Termishield | 2322 E Washington St, Indianapolis, IN 46201 | (317) 827-0166

Termishield 2322 E Washington St, Indianapolis, IN 46201 https://termishieldpestcontrol.com/ (317) 827-0166

Locally owned and family operated since 2007. Indiana license F35923. Pest Control in Indianapolis: Frequently Asked Questions How much will it cost for pest control? Pest control cost in Indianapolis depends on the pest, how widespread the activity is, the size and construction of the property and whether you choose a one-time treatment or ongoing service. Specialty pests such as termites, bed bugs and heavy rodent activity take more time and follow up than general household pests. Termishield gives a property-specific estimate after a free inspection, so you know the scope and price before any treatment begins. Is $70 a month good for pest control? A monthly figure on its own does not tell you much. Compare what is included: how many pests are covered, how often a technician visits, whether interior treatment is part of the plan and whether re-treatments between visits are free. Termishield's Shield Advantage and Shield Premier plans spread quarterly service into monthly convenience payments and include free re-treatments if covered pests return between visits. Ask for the scope in writing before you sign up with any company. How much does it cost to have an exterminator come out? Many companies charge for an initial visit, but Termishield's inspections in Indianapolis are free. A technician checks the inside and outside of the property, confirms which pests are active and how they are getting in, then explains the recommended treatment and price. You decide whether to go ahead once you have that information. Which is the hardest pest to get rid of? Bed bugs, German cockroaches and termites are usually the hardest. Bed bugs hide in tiny cracks and resist many store-bought products, German cockroaches breed fast and travel between apartments, and termites stay hidden inside wood and soil for years. All three need a thorough professional plan with follow up rather than a single spray. Will an exterminator get rid of roaches? Yes, in most cases, provided the treatment reaches where the roaches live and breed. Effective cockroach control uses gel baits, crack and crevice treatment and growth regulators behind appliances, under sinks and inside cabinets, followed by a return visit to catch newly hatched roaches. In apartment buildings and doubles, treating every connected unit gives the best result. What is the best pest control treatment for bed bugs? The most reliable approach is a professional, multi-step plan: a thorough inspection to confirm activity and map its spread, targeted treatment of beds, furniture, baseboards and other hiding places, and follow up visits to catch bugs hatching from eggs. Good preparation, such as laundering bedding on high heat and reducing clutter, is a big part of success. Foggers and

store sprays rarely reach where bed bugs hide. How to spot bed bugs? Check mattress seams, box springs, bed frames and headboards for small rusty or dark spots, pale shed skins, tiny white eggs and the bugs themselves, which are flat, reddish-brown and about the size of an apple seed. Itchy bites in a line or cluster after sleeping can be another clue. If you find signs, avoid moving items to other rooms and book an inspection. What to do if you slept in a bed with bed bugs? Wash the bites with soap and water and avoid scratching them; speak to a pharmacist or doctor if they become infected or you have a strong reaction. Wash the bedding and the clothes you slept in on high heat, bag items before moving them and inspect your luggage if you were traveling. If the bed was in your own home, arrange a professional inspection quickly before the bugs spread to other rooms. How to deter rodents in a house? Take away food, shelter and access. Store dry food and pet food in sealed containers, clear clutter from basements and garages, keep firewood away from exterior walls and trim plants touching the house. Most important of all, seal gaps around pipes, vents, garage doors and foundations, since a mouse can fit through an opening about the width of a pencil. Professional rodent exclusion does this thoroughly. How much do companies charge to get rid of rats? Rat control pricing depends on how many rats are present, where they are nesting and how much exclusion work is needed to seal entry points. Rats are warier than mice and often take longer to remove, so most jobs involve more than one visit. Termishield inspects first and provides a property-specific estimate covering removal and sealing, so the problem does not return. What are the five main methods of pest control? Professional pest control usually combines inspection and monitoring, exclusion (sealing entry points), sanitation and habitat changes such as fixing leaks and removing clutter, mechanical methods such as traps, and targeted product applications such as baits and perimeter treatments. Using them together, often called integrated pest management, controls pests while keeping product use to what is actually needed. How often should pest control be done? Most homes benefit from quarterly service, which lines treatment up with the seasonal changes in pest activity across central Indiana. Homes with recurring infestations, older construction or heavy outdoor pressure may need extra visits until the problem is under control, while some isolated issues only need a single treatment. A free inspection is the best way to decide.
